

Functional Requirement 05

FR-05	Make a group of reservation for a room
Version	2.0
Authors	Javier García
Sources	Stakeholders
Related Goals	OBJ-03
Related Requirements	IR-1, IR-5, IR-8
Description	The system should allow the administrator and neighbors to make groups up to several single bookings .
Precondition	-The user is a person from the neighborhood that has previously been logged into the system. 
Normal Scenario	1.The user selects the group booking option. 2.The system displays the single bookings. 3.The user selects the single bookings from the list. 4.The system receives that information and makes the reservation. 5.The user reviews the reservation details to check that everything is correct. 6.The system displays the reservation data.
Postcondition	If the reservation is successful then the new booking should be registered into the system.
Alternative Scenario	2.If there are no single bookings, the system displays an error message and leaves the process. 5.If the details are not correct, the user remakes the process.
Performance	High
Expected Frequency	Medium
Importance	Very important
Urgency	Urgent
State	Early stages of development
Stability	High level

- 1.1 Missing things. You need to create a set of singel bookings to compose the group booking. For each single booking you need to select the room, the dates, etc... and repeat the process until desired by the user.
