OUTPUT DISPLAY DEVICES

Study and describe any other relevant issues to improve or regarding the aforementioned Hermes system

The different issues and its improvements for the Hermes system:

- For blind people or people who has some kind of eye difficulty:
 - Introduce a voice speech that will help them.
- Battery of the devices problem.
 - The solution would be connect the devices to the electricity.
- Language, as in the university we count with people of different countries:
 - The application will give us the option to change the language
- Where do we place the devices to be reachable for everyone
 - We need to put it in a high that is approachable for every person, taking into account that ones that could need a wheelchair.
- Accessibility
 - One option is to put a QR code that sends you to the application, in this way we wouldn't need to place screens in the corridors of the university.
- Security: screens could be stolen, broken...
 - One solution for this is the same as the accessibility one.
 - If we are talking about cybersecurity: The system should count with an authentication system (for example with the UCLM credentials, or reader from our student cards) in order to be able to go into the application.
